

# Step 1

| SAP Activate Phase |                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
|--------------------|--------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|                    | Description/<br>Purpose                                                                                | Notes/Insights (Relating to GreenHarvest Organics)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |
| Discover           | Understand the business needs, define the project scope, and plan the implementation.                  | <p><i>Answer: provided as an example</i></p> <p><i>Understanding Needs: GreenHarvest needs to improve inventory accuracy, track batch-level expiration dates, and automate order fulfillment to reduce stockouts and spoilage.</i></p> <p><i>Defining Scope: The project scope likely includes implementing modules like SAP S/4HANA Inventory Management, Warehouse Management, and Sales &amp; Distribution</i></p> <p><i>Planning implementation: The implementation plan should consider GreenHarvest's operational schedule and minimize disruption to their distribution.</i></p>                                   |  |
| Prepare            | Set up the project, conduct workshops to gather detailed requirements, and design the future solution. | <i>In the Prepare phase, the project team organizes the implementation structure and gathers detailed requirements. For GreenHarvest Organics, workshops should be conducted with warehouse managers, logistics staff, and sales teams to understand current manual processes and inventory challenges. The team would define detailed requirements such as real-time inventory visibility, batch tracking with expiration dates, and automated order processing. The objective is to design a structured SAP S/4HANA implementation plan that reduces stockouts and spoilage while improving operational efficiency.</i> |  |
| Explore            | Validate the proposed solution design through workshops, prototypes, and demonstrations.               | <i>During the Explore phase, the proposed SAP S/4HANA solution is validated through workshops, demonstrations, and prototype scenarios. For GreenHarvest Organics, stakeholders would review how SAP can support batch management, expiration-date tracking, and automated order fulfillment. Demonstrations would show how real-time inventory visibility can help warehouse teams prioritize shipments based on freshness. Feedback from business users ensures that the proposed system design aligns with operational needs before configuration begins.</i>                                                          |  |
| Realize            | Build and configure the SAP S/4HANA system, migrate data, and test the solution.                       | <i>In the Realize phase, the SAP S/4HANA system is configured and tested according to the approved design. For GreenHarvest Organics, the system would be configured to support batch management, expiration-date tracking, automated availability checks, and order fulfillment processes. Data migration from existing inventory systems would also occur during this phase. Testing activities would ensure that the system accurately tracks product freshness and prevents fulfillment of orders with expired or near-expired products.</i>                                                                          |  |
| Deploy             | Go-live with the SAP S/4HANA system, train users, and provide initial support.                         | <i>The Deploy phase focuses on preparing the organization for go-live and transitioning to the new SAP system. For GreenHarvest Organics, this includes training warehouse staff, logistics teams, and sales personnel on how to use SAP S/4HANA for order processing and inventory management. Data is finalized and the system is activated in the production environment. Initial monitoring and support ensure that the automated order fulfillment and inventory tracking processes function correctly during the transition.</i>                                                                                    |  |

|            |                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |
|------------|---------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Run</b> | Provide ongoing support, maintenance, and continuous improvement of the SAP S/4HANA system. | <i>During the Run phase, the organization focuses on maintaining and continuously improving the SAP system after go-live. GreenHarvest Organics would monitor system performance, analyze inventory trends, and optimize processes to further reduce spoilage and stockouts. SAP analytics tools can be used to evaluate demand patterns and improve forecasting accuracy. Continuous improvements help ensure efficient operations and maintain high customer satisfaction through timely delivery of fresh products.</i> |  |
|------------|---------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|

## Step 2

| Business Analyst Activity             | Description/<br>Purpose                                                                                               | Skills Required                                                                              | Potential Scenarios/Notes/Insights                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conduct Stakeholder Interviews</b> | Meet with stakeholders to gather information about their current processes, challenges, and needs for the new system. | Communication<br>Interpersonal skills<br>Active listening<br>Note-taking                     | <p><i>Sample answer:</i></p> <p><i>Scenario: Imagine interviewing the warehouse manager at a manufacturing company implementing SAP.</i></p> <p><i>Notes: It would be crucial to understand their current inventory management challenges, such as inaccurate stock levels or manual processes. I'd need to ask about their pain points and what they hope to achieve with the new system.</i></p> <p><i>Insights: Building rapport and trust with the warehouse manager would be essential to get honest and detailed information. I'd also need to be mindful of their time and ensure the interview is well-structured and efficient.</i></p> |
| <b>Create Business Process Flows</b>  | Document current ("as-is") business processes and design improved ("to-be") processes for the new system.             | Process mapping<br>Business process understanding<br>Visualization tools                     | <p><i>Scenario: The Business Analyst documents the current ("as-is") order fulfillment and inventory processes and designs improved ("to-be") processes using SAP S/4HANA.</i></p> <p><i>Notes: The new process flows would include automated order confirmation, real-time inventory checks, batch-based product selection, and prioritized shipment based on expiration dates.</i></p> <p><i>Insights: Visual process flows help stakeholders understand how the new system will improve efficiency and reduce manual work.</i></p>                                                                                                            |
| <b>Develop Test Cases</b>             | Design test cases to verify that the implemented solution meets requirements.                                         | Test case design techniques<br>Understanding of testing methodologies<br>Analytical thinking | <p><i>Scenario: The Business Analyst develops test cases to ensure the SAP S/4HANA system functions correctly for GreenHarvest Organics.</i></p> <p><i>Notes: Test cases would include verifying real-time inventory updates, batch tracking with expiration dates, and automated order fulfillment. For example, a test scenario could check whether the system prioritizes products with the earliest expiration dates during order processing.</i></p> <p><i>Insights: Proper test case design ensures that the system supports accurate inventory management and prevents shipping expired or near-expired products.</i></p>                 |

|                                        |                                                                                                          |                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Write Functional Specifications</b> | Document the detailed functional requirements for the solution, specifying how the system should behave. | Technical writing<br>Attention to detail<br>Understanding of system functionalities | <p><i>Scenario: The Business Analyst documents detailed functional specifications describing how SAP S/4HANA should support GreenHarvest's order fulfillment and inventory processes.</i></p> <p><i>Notes: The documentation would describe system behavior such as automatic availability checks, batch management, expiration-date tracking, and automated order confirmation.</i></p> <p><i>Insights: Clear functional specifications help developers and configuration teams implement the system correctly and ensure alignment with business requirements.</i></p>                                   |
| <b>Facilitate Workshops</b>            | Lead workshops with stakeholders to gather requirements, validate solutions, and obtain feedback.        | Facilitation skills<br>Communication<br>Presentation skills                         | <p><i>Scenario: The Business Analyst facilitates workshops with GreenHarvest stakeholders including warehouse managers, logistics coordinators, and sales teams.</i></p> <p><i>Notes: These workshops help gather detailed requirements, validate business processes, and confirm system design decisions. Participants may review process flows for order fulfillment, inventory monitoring, and batch management.</i></p> <p><i>Insights: Workshops promote collaboration, ensure stakeholder alignment, and help identify potential operational challenges early in the implementation process.</i></p> |
| <b>Configuration Documentation</b>     | Document the configuration settings applied to the system to meet specific needs.                        | Technical writing<br>Attention to detail<br>System configuration knowledge          | <p><i>Scenario: The Business Analyst documents configuration settings implemented in SAP S/4HANA to support GreenHarvest's operations.</i></p> <p><i>Notes: This includes documenting settings related to batch management, expiration-date tracking, automated availability checks, and warehouse processes.</i></p> <p><i>Insights: Proper configuration documentation ensures transparency, simplifies troubleshooting, and supports future system maintenance or upgrades.</i></p>                                                                                                                     |
| <b>Data Migration Preparation</b>      | Plan and prepare for the migration of existing data to the new system.                                   | Data analysis<br>Data migration tools knowledge<br>Project management               | <p><i>Scenario: The Business Analyst prepares for the migration of existing inventory and order data into SAP S/4HANA.</i></p> <p><i>Notes: This involves analyzing current data sources, cleaning inaccurate or incomplete records, and mapping legacy data fields to SAP data structures.</i></p> <p><i>Insights: Effective data migration preparation ensures that accurate inventory information is available in the new system, which is critical for managing perishable products and avoiding stock discrepancies.</i></p>                                                                          |

## Step 3

| Business Analyst Activity | SAP Activate Phase(s) | Description of Activity in this Phase | Supporting SAP S/4HANA Capabilities/Tools |
|---------------------------|-----------------------|---------------------------------------|-------------------------------------------|
|---------------------------|-----------------------|---------------------------------------|-------------------------------------------|

|                                        |                                     |                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                             |
|----------------------------------------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Requirements Gathering</b>          | Sample answer:<br>Discover, Prepare | Sample answer:<br><b>Discover:</b> Gather high-level requirements to understand GreenHarvest's needs and define the project scope (e.g., real-time inventory visibility, batch management, automated order fulfillment).<br><b>Prepare:</b> Conduct detailed workshops and interviews to gather specific requirements for inventory management, order fulfillment, reporting, etc. | Sample answer:<br>SAP S/4HANA Embedded Analytics (to analyze current data)<br>SAP Business Process Intelligence (to analyze current processes)<br>SAP Solution Manager/Cloud ALM (to document requirements) |
| <b>Process Mapping</b>                 | Discover, Explore                   | In the Discover phase, the Business Analyst documents high-level business processes to understand GreenHarvest's current operations. During the Explore phase, detailed "as-is" and "to-be" process maps are created to design improved workflows for inventory management, batch tracking, and order fulfillment.                                                                 | SAP Signavio Process Manager<br>SAP Business Process Intelligence<br>SAP Solution Manager                                                                                                                   |
| <b>Gap Analysis</b>                    | Explore, Prepare                    | The Business Analyst compares GreenHarvest's current processes with standard SAP S/4HANA capabilities. Any differences between existing processes and SAP best practices are identified as gaps. Solutions are proposed to address these gaps, such as implementing batch management or automated availability checks.                                                             | SAP Best Practice Explorer<br>SAP Signavio Process Insights<br>SAP Solution Manager                                                                                                                         |
| <b>Solution Design</b>                 | Prepare, Explore                    | The Business Analyst collaborates with technical teams and stakeholders to design a solution that addresses GreenHarvest's operational challenges. This includes defining how SAP S/4HANA will manage batch tracking, expiration-date monitoring, and automated order fulfillment.                                                                                                 | SAP Best Practices Content<br>SAP Solution Manager<br>SAP Cloud ALM                                                                                                                                         |
| <b>Testing</b>                         | Realize                             | During the Realize phase, the Business Analyst supports system testing by validating that configured SAP functions meet business requirements. Test cases verify correct inventory updates, batch tracking, and order processing.                                                                                                                                                  | SAP Solution Manager Test Suite<br>SAP Cloud ALM                                                                                                                                                            |
| <b>Training</b>                        | Deploy                              | The Business Analyst supports user training by explaining new SAP processes and workflows to GreenHarvest employees. Training ensures that staff understand how to manage inventory, process orders, and track product batches using SAP S/4HANA.                                                                                                                                  | SAP Enable Now<br>SAP Learning Hub                                                                                                                                                                          |
| <b>Change Management</b>               | Prepare, Deploy                     | The Business Analyst helps stakeholders adapt to new processes and system changes introduced by SAP S/4HANA. Communication plans, training sessions, and feedback mechanisms are used to support organizational change.                                                                                                                                                            | SAP Enable Now<br>SAP Cloud ALM                                                                                                                                                                             |
| <b>Data Migration</b>                  | Realize, Deploy                     | During the Realize phase, the Business Analyst supports data preparation and validation for migration into SAP S/4HANA. In the Deploy phase, the final data migration is executed and verified to ensure accurate inventory and order data in the production system.                                                                                                               | SAP Migration Cockpit<br>SAP Data Services                                                                                                                                                                  |
| <b>User Acceptance Testing Support</b> | Realize, Deploy                     | The Business Analyst coordinates user acceptance testing to ensure the system meets business needs. GreenHarvest employees test order processing, inventory tracking, and batch management scenarios before final system deployment.                                                                                                                                               | SAP Solution Manager<br>SAP Cloud ALM                                                                                                                                                                       |
