

Developing a Requirements Document

Step 1: Review stakeholder profiles and conduct an analysis

This step involves foundational elements that will build toward your requirements document. You will:

1. Review the provided stakeholder profiles
2. Develop a stakeholder analysis (preferably a stakeholder map or power/interest grid)
3. Compose a stakeholder communication plan

Stakeholder profiles

Review the table below to become familiar with the key players involved in the SAP S/4HANA enhancement for GreenLine Distributors.

Sales Director - Business Process Owner	IT Systems Lead - Technical Implementation Lead	Customer Service Manager - User Representative
Responsibilities: Oversees sales processes, provides requirements for approval automation Potential concerns: Process reliability, impact on KPIs Communication preferences: Weekly progress updates via email and bi-weekly meetings. Gather detailed requirements for the sales order approval workflow. Keep them informed of project progress.	Responsibilities: SAP configuration, workflow automation, system integration Potential concerns: System performance, resource availability Communication preferences: Daily stand-ups, Jira tracking, email for documentation Message content: Technical specs, development progress, integration issues. deployment plans	Responsibilities: Feedback on usability, identifies customer-facing impacts Potential Concerns: Change management and training Communication Preferences: Monthly check-ins, user testing sessions, email for documentation feedback Message content: User interface designs, training materials, change management plans, customer feedback

<i>Maintain their support.</i> Message content: <i>Progress content, key decisions, upcoming milestones, potential risks and issues, changes to requirements</i> Owner/responsible party: <i>Project manager, business analyst</i> Feedback mechanisms: <i>Meeting discussions, email responses, review of deliverables</i> Escalation path: <i>Project manager to executive sponsor</i> Influence on Project: <i>High</i>	Owner/responsible party: <i>IT lead, technical team members</i> Feedback mechanisms: <i>Jira comments, code reviews, testing feedback</i> Escalation path: <i>IT lead to project manager</i> Influence on Project: <i>High</i>	Owner/responsible party: <i>Business analyst, change management lead</i> Feedback mechanisms: <i>User testing results, surveys, feedback on training</i> Escalation path: <i>Business analyst to project manager</i> Influence on Project: <i>Medium</i>
---	--	--

Conduct a stakeholder analysis

List the key stakeholders involved in the SAP S/4HANA enhancement project, including their roles.

Sales Director: Business Process Owner responsible for overseeing sales processes and providing requirements for approval automation.

IT Systems Lead: Technical Implementation Lead responsible for SAP configuration, workflow automation, and system integration.

Customer Service Manager: User Representative responsible for providing feedback on usability and identifying customer-facing impacts.

What does the project team need to achieve by communicating with this stakeholder?

Sales Director: *Gather detailed requirements for the sales order approval workflow, keep them informed of progress, and maintain their support.*

IT Systems Lead: *Align on technical specifications, manage system performance concerns, and coordinate deployment plans.*

Customer Service Manager: Obtain feedback on user interface designs, manage training materials, and ensure change management is effective for users.

Summarize the key insights from your stakeholder analysis.

*The project requires a balance between the **Sales Director's** need for process reliability and the **IT Systems Lead's** focus on technical system performance.*

*While the technical team focuses on automation and integration, the **Customer Service Manager** ensures that the human element and usability are not overlooked during the transition.*

Frequent communication is necessary to mitigate concerns regarding resource availability and potential impacts on existing KPIs.

Fill out the Stakeholder analysis matrix (Power vs. Interest)

This is the second document in your download file. Open it up and fill in the four boxes. Describe your categorization and explain why you categorized each stakeholder this way.

Stakeholder	Communication Method	Frequency	Message Content & Goal
Sales Director	<i>Email & Bi-weekly Meetings</i>	<i>Weekly / Bi-weekly</i>	<i>Progress updates, key decisions, and gathering detailed requirements for approval workflows.</i>

IT Systems Lead	<i>Daily Stand-ups & Jira Tracking</i>	<i>Daily</i>	<i>Technical specifications, integration issues, and deployment planning.</i>
Customer Service Manager	<i>Monthly Check-ins & Email</i>	<i>Monthly</i>	<i>User interface designs, training materials, and collecting user feedback.</i>

Systematic Stakeholder Dimension Matrix

Stakeholder	Power	Interest	Influence on Project	Impact from Project
Sales Director	High	High	High: Final authority on business rules and requirement sign-offs.	High: Targets a specific 40% reduction in processing time for their team.

IT Systems Lead	High	High	High: Manages technical implementation, SAP configuration, and integration.	High: Responsible for technical system performance and resource availability.
Customer Service Manager	Low	High	Medium: Provides feedback on user interface designs and customer impact.	High: Directly affected by change management and training requirements.

High Power, High Interest (Key Players): I placed the **Sales Director** and the **IT Systems Lead** in this category. The Sales Director is the Business Process Owner who oversees sales processes and provides approval requirements, while the IT Systems Lead manages the technical implementation and SAP configuration. Both have a high influence on the project's success and are directly responsible for key deliverables.

Low Power, High Interest (Keep Informed): I categorized the **Customer Service Manager** here. They are highly interested in the project because they represent the end-users and identify customer-facing impacts, but they have medium influence and do not control the technical or financial resources of the SAP enhancement.

High Power, Low Interest (Keep Satisfied): Currently, no primary stakeholders from the provided profiles fall into this quadrant. This area would typically include executive sponsors who need to be kept satisfied with the project's strategic alignment but are not involved in daily operations.

Low Power, Low Interest (Monitor): There are no primary stakeholders in this category for this specific enhancement. This quadrant is reserved for parties who require minimum effort and monitoring throughout the project lifecycle.

Detailed Communication & Engagement Plan

Stakeholder	Frequency	Channel	Milestone / Phase	Message Content & Feedback	Escalation Path
Sales Director	Weekly / Bi-weekly	Email & Meetings	Requirement Sign-off	Progress updates and key decisions. Feedback: Deliverable reviews.	PM to Executive Sponsor
IT Systems Lead	Daily	Stand-ups & Jira	Build / SIT	Technical specs and integration issues. Feedback: Jira comments/code reviews.	IT Lead to PM

CS Manager	Monthly	Check-ins & Testing	UAT	UI designs and training materials. Feedback: User testing results/surveys.	BA to PM
-------------------	---------	---------------------	------------	---	----------

Create your stakeholder communication plan

Using the stakeholder analysis you've conducted, develop a communication plan to ensure effective engagement throughout the project. This plan should outline how you will communicate with each stakeholder, considering their specific needs and preferences. A well-crafted communication plan will help manage expectations, minimize disruptions, and foster collaboration among stakeholders.

Sales Director: Weekly email progress updates and bi-weekly meetings to discuss key decisions and milestones.

IT Systems Lead: Daily stand-ups and Jira tracking for technical specifications and integration issues.

Customer Service Manager: Monthly check-ins and user testing sessions for feedback on designs and training materials.

Phase-Linked Risk Mitigation

- **Discovery Phase:** Risk of incomplete requirements from the Sales Director. *Mitigation:* Conduct structured interviews to identify pain points and business rules early.
- **Build Phase:** Technical system performance limitations identified by the IT Lead. *Mitigation:* Align on technical specifications during daily stand-ups to coordinate deployment.

- **UAT Phase:** Risk of ineffective change management for users. *Mitigation:* The Customer Service Manager will manage training materials and provide feedback on UI designs.

Step 2: Requirements elicitation

This section guides you in planning and conducting requirements elicitation for the SAP S/4HANA enhancement project.

Describe your approach to eliciting requirements

Which elicitation techniques will you use, and why are they appropriate for this project and the stakeholders?

Interviews: I will conduct one-on-one interviews with the Sales Director to identify specific business rules and pain points in the current manual approval process.

Workshops: I will facilitate technical workshops with the IT Systems Lead to discuss system integration constraints and S/4HANA configuration requirements.

User Observations/Testing: I will observe or run testing sessions with the Customer Service team to understand how the automation affects their daily workflow and customer interactions.

How will you prepare for your elicitation sessions (e.g., developing questions, preparing materials)?

- *I will review the existing "As-Is" process documentation for manual sales approvals to establish a baseline.*
- *I will develop a structured set of open-ended questions tailored to each stakeholder's specific role and concerns.*
- *I will prepare visual aids, such as draft process flowcharts or mockups of the e-commerce integration, to facilitate clearer discussions during workshops.*

How will you ensure you gather complete and accurate requirements?

- I will use the **INVEST criteria** (*Independent, Negotiable, Valuable, Estimable, Small, Testable*) to validate every requirement gathered.
- I will perform **cross-functional verification** to ensure that business requirements from the Sales Director are technically feasible for the IT team.
- I will utilize **active listening and playback techniques** during sessions to confirm my understanding with the stakeholders immediately.

How will you manage stakeholder communication and engagement during the elicitation process?

- I will provide regular status updates using the stakeholders' preferred communication channels (e.g., weekly emails for the Sales Director, Jira updates for IT).
- I will clearly communicate the purpose and expected outcomes of each session beforehand to ensure stakeholders are prepared.
- I will maintain a transparent **feedback loop**, sharing meeting minutes and summarized requirements for stakeholder sign-off to ensure alignment.

How will you document the elicited requirements?

- I will use the standardized **Requirements Document template** provided in the project file to ensure all functional and non-functional needs are captured.
- I will translate the requirements into clear **User Stories** and **Use Cases** to bridge the gap between business needs and technical execution.
- I will maintain a **Traceability Matrix** to link each requirement back to its original stakeholder and the project's strategic goals.

Provide elicitation questions/prompts

Provide examples of the questions or prompts you will use during your elicitation sessions with each stakeholder.

Sales Director - Business process owner

Question 1: *"What specific business rules (e.g., credit limits or order value) should trigger an automatic approval, and which scenarios must still require manual intervention to ensure process reliability?"*

Question 2: *"How will we measure the success of the 40% reduction in processing time, and are there specific KPIs currently being impacted by manual delays that you want to track in S/4HANA?"*

IT Systems Lead - Technical implementation lead

Question 1: "Are there any existing API constraints or system performance limitations within our current SAP S/4HANA environment that could affect the real-time integration with the new e-commerce platform?"

Question 2: "What are the security requirements for data mapping between the e-commerce platform and SAP to ensure data integrity and prevent unauthorized access during the automated intake process?"

Customer service manager - User representative

Question 1: *"How should the system communicate order status changes to customers in real-time once the automated approval is triggered, and what information do users need to see to handle inquiries efficiently?"*

Question 2: *"What specific concerns does your team have regarding the transition to an automated workflow, and what features would make the new interface more user-friendly for your staff?"*

Step 3: User story creation

This section guides you in creating your user stories and documenting your data. You will use the table below for this.

User story table

Ensure that each user story is clear, concise, and follows the INVEST criteria. It would be a good idea to review the questions underneath the table before you begin to understand the full scope of Step 3. You will answer these questions once your user stories have been completed.

	User story 1	User story 2	User story 3
Title	Automated Sales Approval	E-commerce Integration	Order Status Visibility
As a	Sales Director	E-commerce Customer	Customer Service Manager
I want to	automatically approve orders based on credit limits	have my order details sent directly to SAP S/4HANA	see real-time status updates on the dashboard
So that	processing time is reduced by 40%	order intake is streamlined and error-free	I can provide accurate info to customers
Acceptable criteria	Order < \$10k & within credit limit = Auto-approved	Data must sync within 5 seconds of customer checkout	System must show "Auto-Approved" or "Pending Review" status
FIT or GAP	FIT	GAP	FIT
Independent? (Yes/No)	Yes	Yes	Yes
Negotiable? (Yes/No)	Yes	Yes	Yes
Valuable? (Yes/No)	Yes	Yes	Yes

Estimable? (Yes/No)	Yes	Yes	Yes
Small? (Yes/No)	Yes	Yes	Yes
Testable? (Yes/No)	Yes	Yes	Yes

Further analysis

Answer the following questions to further analyze your user stories:

For each user story, explain why you categorized it as FIT or GAP.

SAP S/4HANA has native workflow capabilities and business rule frameworks that can be configured to automate approvals without custom code.

Describe any dependencies between your user stories. If a story is not independent, how will you address this?

Integrating an external e-commerce platform with SAP S/4HANA typically requires custom API development or middleware configuration as it is not a "plug-and-play" standard feature.

Explain how you will ensure that your user stories are valuable to the stakeholders.

Standard SAP Fiori dashboards and sales order monitors provide the necessary visibility into order statuses out of the box.

Describe any dependencies between your user stories. If a story is not independent, how will you address this?

- **Dependency:** User Story 1 (Automation) depends on User Story 2 (Integration) because the system cannot approve an order that hasn't been successfully transferred from the e-commerce platform.
- **Address:** I will prioritize the technical integration (Story 2) in the first sprint to ensure the data flow is established before activating the automation logic (Story 1).

What are the key tasks that need to be completed to fulfill each user story?

Task 1: Configure SAP Workflow business rules for credit and value thresholds.

Task 2: *Develop and test API endpoints for data mapping between the e-commerce platform and SAP.*

Task 3: *Set up Fiori tiles and roles for Customer Service visibility.*

How will you ensure that your user stories are testable and have clear acceptance criteria?

I will use **Gherkin syntax** (*Given-When-Then*) to define clear, binary outcomes for testing and involve the IT Systems Lead in reviewing the technical feasibility of each criteria.

Step 4: Use case development

Analyze the user stories and the system context to define relevant use cases. You can use ChatGPT to help refine the use cases or to create alternative scenarios. This step is very important to getting your requirements document completed in Step 5.

1. Develop use cases for the key functionalities identified in the user stories. For each use case, complete the following template:

Use case ID

UC-001

Use case name

Automated Sales Order Approval and Intake

Created by

Tuncay Şahin

Date created

08.04.2026

Last updated

08.04.2026

Actors

E-commerce Customer / Sales Representative

Goal

To automate the transfer of orders from the e-commerce platform and process approvals in SAP S/4HANA without manual intervention.

Description

This use case describes the automated process of capturing sales orders from an external e-commerce platform and executing an immediate approval logic within SAP S/4HANA based on predefined business rules to eliminate manual delays.

Preconditions

- 1. The e-commerce platform is successfully integrated with SAP S/4HANA via API.*
- 2. Approval business rules (credit limits, order value thresholds) are configured in the SAP system.*
- 3. The customer has a valid account and sufficient credit limit.*

Postconditions

The sales order is created and approved in SAP S/4HANA.

Inventory levels are adjusted accordingly.

The processing time is recorded to track the 40% reduction goal.

Trigger

The process is initiated when a customer completes the checkout process and submits an order on the integrated GreenLine e-commerce platform.

Basic flow

- 1. The Customer places an order on the e-commerce platform.*

2. *The system automatically transfers the order details to SAP S/4HANA.*
3. *SAP S/4HANA validates the order against predefined business rules (e.g., Order Value < \$10,000 and Customer within Credit Limit).*
4. *The system automatically approves the order.*
5. *The order status is updated to "Approved" on the Customer Service dashboard.*
6. *An automated notification is sent to the customer.*

Alternative flows

A1: Manual Review Required: *If the order value exceeds \$10,000 or the credit limit is exceeded, the system routes the order to the Sales Director for manual approval.*

A2: Integration Failure: *If the API transfer fails, the system logs an error in the IT monitor and triggers a retry mechanism.*

Exceptions

- **EX-01 (Data Mismatch):** *The incoming order data contains invalid customer or material numbers that do not exist in SAP S/4HANA master data.*
- **EX-02 (System Timeout):** *The connection between the e-commerce middleware and SAP S/4HANA is lost during the data transfer.*
- **EX-03 (Technical Error):** *The SAP Workflow engine fails to trigger due to a technical system exception.*

Assumptions

- *It is assumed that the e-commerce platform and SAP S/4HANA have a stable and secure API connection.*
- *It is assumed that the Sales Director has already provided and approved the specific financial thresholds for the automated rules.*
- *It is assumed that the customer's master data and credit limits are accurately maintained within the SAP system.*

2. **In what ways do your use cases align with the user stories developed in Step 3, and what aspects of the SAP context do they address? Provide specific examples.**

*The use cases align with Step 3 by transforming high-level user needs into detailed functional steps. For example, the **"Automated Sales Approval" user story** is realized in the Use Case through a specific validation step where the system checks the \$10,000 threshold and credit limits. Regarding the **SAP context**, the use case addresses:*

- **Workflow Automation:** Specifically utilizes the S/4HANA Business Workflow engine to route orders based on logic rather than manual intervention.
- **Integration Patterns:** Addresses the GAP identified in Step 3 by detailing how external e-commerce data is mapped and processed within standard SAP sales tables.
- **Visibility:** Ensures that "Postconditions" reflect real-time updates in SAP Fiori dashboards for the Customer Service Manager.

Step 5: Requirements documentation

Now it's time to complete the requirements document template. Use the template below to compile the information gathered in the previous steps. Ensure that all sections of the template are completed with accurate and detailed information. We have provided you a checklist below the template to use after your first draft is complete.

Requirements document template

1. Introduction

This project aims to enhance the SAP S/4HANA system for GreenLine Distributors by automating the sales order approval workflow and integrating it with a new e-commerce platform. The purpose of this document is to define the functional, non-functional, and stakeholder requirements necessary to reduce processing time by 40% and support sustainable scaling.

2. Business requirements

- *Reduce manual sales order processing time by 40% through automation.*
- *Seamlessly integrate external e-commerce order intake with the core SAP S/4HANA system.*
- *Improve customer satisfaction by providing faster order confirmations and real-time status visibility.*

3. Functional requirements

- **FR001:** *The system shall automatically approve sales orders that are below \$10,000 and within the customer's available credit limit.*
- **FR002:** *The system shall route orders exceeding \$10,000 or credit limits to the Sales Director for manual review.*
- **FR003:** *The SAP system shall receive and map order data from the e-commerce platform API in real-time.*

4. Non-functional requirements

- **Performance:** *The integration API must process and sync order data within 5 seconds of customer checkout.*
- **Security:** *All data transfers between the e-commerce platform and SAP S/4HANA must be encrypted and follow identity management protocols.*
- **Usability:** *The Customer Service dashboard must update status changes in real-time with clear visual indicators.*

5. Assumptions and constraints

- **Assumption:** *The Sales Director provides finalized business rules for automation thresholds prior to configuration.*
- **Constraint:** *The enhancement must be compatible with the existing SAP S/4HANA architecture without degrading system performance.*

6. Stakeholder requirements

- **Sales Director:** *Requires reliable automation to ensure no high-risk orders are approved without oversight.*
- **IT Systems Lead:** *Requires clear technical specifications for API mapping and workflow triggers.*
- **Customer Service Manager:** *Requires training materials and a user-friendly Fiori interface for tracking automated orders.*

7. Acceptance criteria

Define the conditions that must be met for the solution to be accepted by the stakeholders.

- **Automation Success Rate:** 100% of sales orders that meet the predefined business rules (Value < \$10k and within Credit Limit) must be auto-approved without manual intervention.
- **Processing Efficiency:** The end-to-end processing time from order intake to approval must show a measurable reduction of at least 40%.
- **Integration Integrity:** Order data transferred from the e-commerce platform must match SAP S/4HANA records with 100% accuracy and zero data loss.
- **System Performance:** The API sync between systems must complete within a 5-second threshold during peak hours.
- **User Readiness:** Customer Service and Sales teams must confirm they can successfully track and manage orders via the new Fiori dashboard.

Your Requirements Document Checklist 	Key Sections
A high-level overview of automating sales approvals and e-commerce integration to drive growth and efficiency.	Executive Summary
Background on GreenLine Distributors' transition to SAP S/4HANA to handle increased demand sustainably.	Project overview

Detailed grid and communication strategy for the Sales Director, IT Lead, and Customer Service Manager.	Stakeholder analysis and communication plan
INVEST-compliant stories categorized by standard SAP functionality (FIT) vs. custom API development (GAP).	User stories (categorized as FIT/GAP)
Detailed flow (UC-001) for automated intake and approval, including triggers, basic steps, and exceptions.	Use cases
Specific "Shall" statements (FR001, FR002) defining auto-approval logic and routing rules.	Functional requirements
Performance, security, and scalability metrics ensuring the system remains robust under load.	Non-functional requirements
API mapping specifications and security protocols for the S/4HANA to e-commerce integration.	Technical requirements (if applicable)
Explicit mapping of requirements to the goals of 40% time reduction and improved customer satisfaction.	Strategic alignment

Alignment with project goals

Explain how the requirements documented in each section aligns with the overall project goals of scaling sustainably, reducing processing time by 40%, and improving customer satisfaction. Provide specific examples.

The requirements documented above directly support GreenLine Distributors' goal of scaling sustainably by replacing manual, error-prone tasks with automated SAP workflows. The 40% reduction in processing time is achieved through FR001 and FR002, which eliminate the need for human review on standard low-risk orders. Finally, the improvement in customer satisfaction is ensured by the real-time integration and status visibility provided to the Customer Service team.

Quality and completeness check

Review your Requirements Document and confirm that it meets the following criteria. Record your answer as well as an explanation to defend your answer. Everything in Step 5 will be copied and pasted into the AI Grader so double check your work carefully. You are allowed to use ChatGPT to help review and edit the language to make sure everything is clear and concise. Please be honest and ensure it's reviewing your own original work.

Criteria **Yes/No - Yes**

The document meets all professional SAP Business Analysis standards.

The Requirements Document has been developed using industry-standard methodologies, ensuring that all functional and technical aspects of the GreenLine Distributors enhancement are addressed accurately and aligned with strategic goals.

Completeness **Yes/No - Yes**

The Requirements Document is complete because it includes all mandatory sections such as stakeholder profiles, communication plans, user stories with FIT/GAP analysis, and detailed use cases.

Clarity **Yes/No - Yes**

Every requirement follows the standard "shall" format and utilizes clear, concise language to ensure that both business stakeholders and technical teams can interpret the goals without ambiguity.

Consistency Yes/No - Yes

The requirements are internally consistent, as the functional requirements for automated approvals (FR001, FR002) directly align with the overarching strategic goal of reducing processing time by 40%.

Traceability Yes/No - Yes

Traceability is established by linking each functional requirement back to its original stakeholder need (e.g., Sales Director's automation needs) and corresponding user stories.

Testability Yes/No - Yes

The requirements include specific, quantifiable thresholds—such as the "\$10,000 order value limit"—which provide objective criteria for binary pass/fail testing.
