
Developing comprehensive acceptance criteria

Step 1: Review the user stories and identify the key functionalities

Key functionalities for User Story 1:

- Stock Level Monitoring: The system must continuously or periodically check the stock levels of parts.
- Reorder Point Comparison: The system must compare the current stock level against the predefined reorder point for each part.
- Alert Generation: When the stock level falls below the reorder point, the system must generate an alert.
- Alert Delivery: The system must deliver the alert to the inventory manager.
- Information Inclusion: The alert must include relevant information such as the part number, current stock level, and reorder point.

Key functionalities for User Story 2:

- Real-time Inventory Access: The system must provide instant access to current stock levels for sales representatives.
- ATP (Available-to-Promise) Check: The system must calculate availability based on current stock and confirmed future receipts.

Key functionalities for User Story 3:

- Goods Receipt Processing: The system must allow users to record the arrival of new parts against purchase orders.
- Inventory Balance Update: The system must update stock counts immediately upon document posting.

Key functionalities for User Story 4:

- Inspection Result Recording: The system must capture quality check outcomes (Pass/Fail/Partial).
- Stock Status Management: The system must automatically move parts to "Unrestricted" or "Blocked" based on the inspection result.

Key functionalities for User Story 5:

- Shipping Label Trigger: The system must generate a print-ready label from a validated delivery document.
- Data Integration: The label must pull real-time data including shipping address and tracking numbers.

Step 2: Write clear and testable acceptance criteria for each user story

User Story 1 Acceptance Criteria

- **Acceptance criteria 1:**
 - Given: The current stock level of part "ABC-123" is 10 units.
 - And: The reorder point for "ABC-123" is 15 units.
 - When: The system performs a stock level check.
 - Then: An alert is generated and sent to the inventory manager.
 - And: The alert message includes Part number: "ABC-123", Current stock level: "10", and Reorder point: "15".
 - And: The alert is delivered via email and logged in the system's notification history.
 - And: The system performs stock level checks every 4 hours.
- **Acceptance criteria 2:**
 - Given: The current stock level of part "XYZ-789" is 20 units.
 - And: The reorder point for "XYZ-789" is 15 units.
 - When: The system performs a stock level check.
 - Then: No alert is generated.

User Story 2 Acceptance Criteria

- **Acceptance criteria 1:**
 - Given: Part "JET-PUMP" has an unrestricted stock of 50 units.
 - When: A sales representative queries the stock for "JET-PUMP".
 - Then: The system displays exactly 50 units as available in real-time.

User Story 3 Acceptance Criteria

- **Acceptance criteria 1:**
 - Given: A purchase order for 100 units of "BOLT-99" is open.
 - When: The warehouse worker posts a Goods Receipt for these 100 units.
 - Then: The system increases the stock of "BOLT-99" by 100 units immediately.

User Story 4 Acceptance Criteria

- **Acceptance criteria 1:**
 - Given: 10 units of "VALVE-01" are in Quality Inspection status.
 - When: The inspector records a "Pass" result for all 10 units.
 - Then: The system automatically moves all 10 units to Unrestricted-use stock.

User Story 5 Acceptance Criteria

- **Acceptance criteria 1:**
 - Given: A delivery document has been finalized for Order #555.
 - When: The shipping clerk selects the "Generate Label" option.
 - Then: The system prints a label containing the correct destination address and a scannable barcode.
-
