

Activity: Analyze and optimize a process diagram in SAP Process Manager

Current State: Pipeline Monitoring and Maintenance Scheduling Process

Process diagram being analyzed in this exercise

Step 1: Analyze the Process Diagram in SAP Process Manager

- **Manual Bottleneck in Data Entry:** The technician is required to manually log incident data into a spreadsheet after a sensor trigger. This creates a significant delay in real-time monitoring and introduces human error.
- **Inefficient Re-work Loop:** When alerts are inconsistent across data sources, the technician must perform a manual re-check of sensors. This indicates a lack of automated data cross-referencing and validation protocols.

- **Disconnected Communication (Email Handovers):** The maintenance request is sent via email to the scheduler. This non-systemized approach leads to information silos and potential loss of critical requests.
- **Non-Standardized Verification:** The scheduler must manually check open tickets before escalating to the Ops Manager. This adds an unnecessary administrative layer and slows down the response time.

Step 2: Evaluate impact

- **Operational Risk:** Manual logging and email delays can result in missed critical alerts, leading to environmental hazards or pipeline failures.
- **Increased Labor Costs:** Re-work loops (manual sensor re-checks) waste highly skilled technician hours on redundant tasks.
- **Inconsistent Scheduling:** Manual ticket checking and approval flows lead to poorly coordinated maintenance programs and higher operational costs.

Step 3: Propose solutions

Solution 1: IoT and SAP S/4HANA Integration

- **Action:** Eliminate the "Manual Log" step. Use SAP IoT connectors to feed sensor data directly into the SAP S/4HANA system.
- **Benefit:** Provides real-time visibility and eliminates human error during data entry.

Solution 2: Automated Data Validation (Signavio/SAC)

- **Action:** Implement automated cross-source validation. If sensors disagree, the system should trigger a diagnostic routine instead of a manual re-check.
- **Benefit:** Reduces the re-work loop and ensures data-driven decision-making.

Solution 3: Automated Workflow and Fiori Notifications

- **Action:** Replace email requests with automated SAP Workflows. Notifications should appear directly on the Scheduler's and Ops Manager's **SAP Fiori** launchpads.
- **Benefit:** Streamlines communication and ensures faster maintenance approvals, reducing unplanned downtime.
